ABSTRACT

Solar air heater (SAH) is special kind of heat exchanger that transfers thermal energy from the solar radiation to the fluid flowing inside of the collector. The most potential applications of SAH the supply of hot air for heating of buildings, to maintain a comfortable environment especially in the winter season, air preheating, desiccant refrigeration, and drying of vegetables, fruits, meat, textile and marine products. Solar radiation intensity is less in the morning that increase gradually till noon and again decrease from noon to evening. The heat gain is directly proportional to the mass flow rate.

Keywords - Absorbers, Duct, Glazing, Solar Air Heater, Solar radiation

1. Introduction

Solar air heater (SAH) is special kind of heat exchanger that transfers thermal energy from the solar radiation to the fluid flowing inside of the collector. With the development of computer, hardware and numerical methodology, advanced mathematical models are being used to carry out critical investigations on SAH. The purpose of this work is to review the present state of mathematical modelling of SAHs. The validation is an important step in mathematical modelling development, and therefore comparisons with actual experimental values or theoretical results have been included where possible.

Modifications were made in the geometry of absorber plate and instead of a conventional flat absorber plate; absorber having dimple pockets was used to increase the heat transfer capacity of the system. Based on the comparative study [5] it was concluded that there is significant rise in average surface temperature of absorber plate because of use of dimples in the absorber plate.

2. Components of SAH

Schematic diagram of a solar air heater that converts solar radiation into heat is shown in "Fig 1". The basic principle is that the heat from the warming absorber plate is absorbed by air circulating [6][7] around it. A typical flat plate SAH consists of the following

Fig.1 Basic SAH Design

- Absorber plate: function of the absorber plate is to absorb maximum solar radiation incident on it and to transfer the absorbed heat to the air flowing along the duct.
- Selective absorber coating: A selective coating is usually applied over absorber plate which helps in improving efficiency by increasing the absorptivity of the absorber plate and decreasing radiative loss.
- Glazing: A glazing (a transparent glass) allow the incident solar radiation for entering the device and substantially restricting infrared energy losses through re-radiation.
- Duct/passages: In SAHs, the ducts are used to supply the fresh air and exhaust of warm/hot air by the means of natural and forced convection. The artificial surface roughness provided on the ducts or on the absorber plates of SAHs has a favorable effect on the heat transfer.
- Blower: Fluid motion is dominant to convection heat transfer and concerned with two basic flow classifications i.e forced convection in which fluid motion is generated mechanically by using a fan, blower, pump, etc. The first step in the design of a fan/blower/pump system is the calculation of the quantity of the air to be handled and the amount of heat, which must be imparted to it.
- Insulation: Thermal insulation is the simplest way to prevent heat losses and to achieve economy in energy usage especially in solar thermal systems. Some commonly used thermal insulation materials are as; glass, fibre, alumina silicate, mineral wool and calcium silicate, among which the glass-wool has been noticed to be used as an insulator in SAHS, commonly glass-wool has been found a commonly used insulator in SAHS.

2.1 Energy balance equation for absorber plate
The energy balance equations for the absorber plate can be written as:
Rate of heat absorbed by the selective absorber = Heat capacity of selective absorber+ Rate of heat transfer from selective absorber to the fluid by convection + Rate of heat transfer from the selective absorber to the absorber plate by radiation+ Rate of heat loss to ambient air by convection and radiation

$$\alpha_s I(t) = m_s C_{ps}\left(\frac{dT_s}{dt}\right) + h_{csf}\left(T_s - T_f\right) + h_{rsp}\left(T_s - T_p\right) + \left(h_{csa} + h_{rsa}\right)\left(T_s - T_a\right)$$ (1)

Neglecting the heat capacity of the selective absorber and simplifying eqn (1), the temperature of the glass cover is given by

$$T_s = \frac{\alpha_s I(t) + (h_{csa} + h_{rsa})T_a + h_{csf}T_f + h_{rsp}T_p}{h_{csa} + h_{rsa} + h_{csf} + h_{rsp}}$$ (2)

3.2   Energy balance equation for bottom plate

The energy balance equations for the glass cover can be written as:

Rate of heat transfer from the selective absorber to the bottom plate by radiation = Heat capacity of bottom plate + Rate of heat convected to the fluid by bottom plate + Bottom loss

$$h_{rsp}\left(T_s - T_p\right) = m_p C_{pp}\left(\frac{dT_p}{dt}\right) + h_{cpf}\left(T_p - T_f\right) + U_b\left(T_p - T_a\right)$$ (3)

3.3   Energy balance equation for air flowing in the duct

The energy balance equation for the air flowing through the duct can be written as:

Rate of heat transfer from selective absorber to the fluid by convection + Rate of heat convected to the fluid by bottom plate = Heat capacity of the air + heat gain

$$h_{csf}\left(T_s - T_f\right) + h_{cpf}\left(T_p - T_f\right) = \rho_f t_f C_{pf}\left(\frac{dT_f}{dt}\right) + \frac{m_f C_{pf}}{W}\left(\frac{dT_f}{dx}\right)$$ (4)

where $m_f = \rho_f t_f W V_f$ Neglecting the heat capacity of the air flowing through the duct and eliminating, $T_s \ and \ T_p$,

$$m_f C_{pf}\frac{\partial T_f}{\partial x} = WF'\left[\alpha_s I(t) - U_L\left(T_f - T_a\right)\right]$$ (5)

where $F' \ and \ U_L$ are the collector efficiency factor and

Overall heat transfer coefficient Collector efficiency factor (F') is given by

$$F' = \frac{h_{rsp}h_{cpf} + h_{csf}U_b + h_{csf}h_{rsp} + h_{csf}h_{cpf}}{\left(U_b + h_{rsp} + h_{cpf}\right)\left(h_{csa} + h_{rsa} + h_{csf} + h_{rsp}\right) - \left(h_{rps}\right)^2}$$ (6)

Overall heat transfer coefficient of the collector (U_L) is

$$U_L = \frac{\left(h_{csa} + h_{rsa} + U_b\right)\left(h_{csf}h_{cpf} + h_{cpf}h_{rsp} + h_{csf}h_{rsp}\right) + U_b\left(h_{csa} + h_{rsa}\right)\left(h_{cpf} + h_{csf}\right)}{h_{cpf}h_{rsp} + h_{csf}U_b + h_{csf}h_{rsp} + h_{cpf}h_{csf}}$$ (7)

The solution of equation is given by

$$\frac{T_f - T_a - \left(\alpha_s I(t)/U_L\right)}{T_{fi} - T_a - \left(\alpha_s I(t)/U_L\right)} = \exp\left(\frac{-U_L F' W x}{m_f C_{pf}}\right)$$ (8)

Applying boundary conditions in eq,

$T_f = T_{fi} \ at \ x = 0 \ and \ T_f = T_{fo} \ at \ x = L$, the outlet temperature is given by

$$T_{fo} = \left(\frac{\alpha_s I(t) + U_L T_a}{U_L}\right)\left[1 - \exp\left(\frac{-U_L WF'L}{m_f C_{pf}}\right)\right] + T_{fi}\exp\left(\frac{-U_L WF'L}{m_f C_{pf}}\right)$$ (9)

And mean temperature is given by

$$T_{fm} = \left(\frac{\alpha_s I(t) + U_L T_a}{U_L}\right)\left[1 - \frac{1 - \exp\left(\frac{-U_L WF'L}{m_f C_{pf}}\right)}{\left(\frac{-U_L WF'L}{m_f C_{pf}}\right)}\right] + T_{fi}\exp\left[\frac{1 - \exp\left(\frac{-U_L WF'L}{m_f C_{pf}}\right)}{\left(\frac{-U_L WF'L}{m_f C_{pf}}\right)}\right]$$ (10)

The whole system is installed on a stand and blower is used for forced circulation of the air through the duct, between the glass cover and the absorber plate.

Fig. 4 Cross sectional view and nomenclature

2.2 Energy balance equation for glass cover

The energy balance equations for the glass cover can be written as:

Rate of heat absorbed by the Glass cover = Heat capacity of glass+ Rate of heat transfer from Glass cover to the fluid by convection + Rate of heat transfer from the glass cover to the absorber plate by radiation+ Rate of heat loss to ambient air by convection and radiation

$$\alpha_g I(t) = m_g C_{pg}\left(\frac{dT_g}{dt}\right) + h_{cgf}\left(T_g - T_f\right) + h_{rgp}\left(T_g - T_p\right) + \left(h_{cga} + h_{rga}\right)\left(T_g - T_a\right) \tag{11}$$

Neglecting the heat capacity of the glass cover and simplifying equation, the temperature of the glass cover is given by

$$T_g = \frac{\alpha_g I(t) + \left(h_{cga} + h_{rga}\right)T_a + h_{cgf}T_f + h_{rgp}T_p}{h_{cga} + h_{rga} + h_{cgf} + h_{rgp}} \tag{12}$$

2.3 Energy balance equation for absorber plate

The energy balance equations for the absorber plate with insulation can be written as:

Rate of heat absorbed by absorber plate + Rate of heat transfer from the glass cover to the absorber plate by radiation = Heat capacity of absorber plate + Rate of heat convected to the fluid from absorber plate + Bottom loss

$$\tau_g \alpha_p I(t) + h_{rgp}\left(T_g - T_p\right) = m_p C_p\left(\frac{dT_p}{dt}\right) + h_{cpf}(T_p - T_f) + U_b(T_p - T_a) \tag{13} \tag{3.14}$$

Neglecting the heat capacity of absorber plate and substituting the value of T_g from equations the absorber plate temperature is given by

$$T_p = \frac{\begin{aligned}&\alpha_g I(t)h_{rgp} + \alpha_p \tau_g I(t)\left(h_{cga} + h_{rga} + h_{rgp} + h_{cgf}\right)\\ &+\left\{\left(h_{cga} + h_{rga}\right)h_{rgp} + \left(h_{cga} + h_{cgf} + h_{rgp} + h_{cgf}\right)U_b\right\}T_a\\ &+\left\{h_{rgp}h_{cgf} + \left(h_{cga} + h_{rga} + h_{cgf} + h_{rgp}\right)h_{cpf}\right\}T_f\end{aligned}}{\left(h_{cga} + h_{rga} + h_{cgf} + h_{rgp}\right)\left(h_{cpf} + h_{rgp} + U_b\right) - h_{rgp}^2} \tag{14}$$

2.4 Energy balance equation for air flowing in the duct

The energy balance equation for the air flowing through the duct can be written as:
Rate of heat transfer from Glass cover to the fluid by convection + Rate of heat convected to the fluid from absorber plate = Heat capacity of the air + heat gain

$$h_{cgf}\left(T_g - T_f\right) + h_{cpf}\left(T_p - T_f\right) = \rho_f t_f C_{pf}\left(\frac{\partial T_f}{\partial t}\right) + \frac{m_f C_{pf}}{W}\frac{\partial T_f}{\partial x} \quad (15)$$

(3.16)

Where $m_f = \rho_f t_f W V_f$ Neglecting the heat capacity of the air flowing through the duct and eliminating, T_g and T_p,

$$m_f C_{pf}\frac{\partial T_f}{\partial x} = WF'\left[\tau_g \alpha_p I(t) - U_L\left(T_f - T_a\right)\right] \quad (16)$$

Where F' and U_L are the collector efficiency factor and Overall heat transfer coefficient.
Collector efficiency factor (F') is given by

$$F' = \frac{h_{rpg}h_{cgf} + h_{cpf}\left(h_{cga} + h_{rga}\right) + h_{cpf}h_{rpg} + h_{cgf}h_{cpf}}{\left(U_b + h_{rgp} + h_{cpf}\right)\left(h_{cga} + h_{rga} + h_{cpf} + h_{rgp}\right) - \left(h_{rgp}\right)^2} \quad (17)$$

(3.18)

Overall heat transfer coefficient of the collector (U_L) is given by

$$U_L = \frac{\left(h_{cga} + h_{rga} + U_b\right)\left(h_{cgf}h_{cpf} + h_{cgf}h_{rgp} + h_{cpf}h_{rgp}\right) + U_b\left(h_{cga} + h_{rga}\right)\left(h_{cpf} + h_{cgf}\right)}{h_{cpf}\left(h_{cga} + h_{rgp} + h_{cgf}\right) + h_{cgf}h_{rpg} + h_{cgf}h_{rga}} \quad (18)$$

(3.19)

Assuming U_L and F' to be constant and applying boundary conditions $T_f = T_{fi}$ at $x = 0$, the solution of equation is given by

$$\frac{T_f - T_a - \left(\dfrac{\tau_g \alpha_P I(t)}{U_L}\right)}{T_{fi} - T_a - \left(\dfrac{\tau_g \alpha_P I(t)}{U_L}\right)} = \exp\left(\frac{-U_L F' W x}{m_f C_{pf}}\right) \quad (19)$$

(3.20)

The outlet fluid temperature is obtained by substituting $T_f = T_{fo}$ at $x = L$

$$T_{fo} = \frac{\left(\tau_g \alpha_p I(t) + U_L T_a\right)}{U_L}\left[1 - \exp\frac{\left(-U_L W F'\right)}{m_f c_{pf}}L\right] + T_{fi}\exp\left(\frac{-U_L W F' L}{m_f c_{pf}}\right)$$

(3.21)

The mean air temperature is given by

$$T_{fm} = \frac{\left(\tau_g \alpha_p I(t) + U_L T_a\right)}{U_L}\left[1 - \frac{\left[1 - \exp\dfrac{\left(-U_L W F'\right)}{m_f c_{pf}}L\right]}{\dfrac{\left(U_L W F'\right)}{m_f c_{pf}}}\right] + T_{fi}\exp\left[\frac{\left[1 - \exp\dfrac{\left(-U_L W F'\right)}{m_f c_{pf}}L\right]}{\dfrac{\left(U_L W F'\right)}{m_f c_{pf}}}\right] \quad (20)$$

2.5 Energy balance equation for top glass cover

The energy balance equations for the glass cover can be written as:
Rate of heat absorbed by the Glass cover = Heat capacity of glass+ Rate of heat transfer by first glass cover to the second glass by convection + Rate of heat transfer from the first glass cover to second glass cover by radiation+ Rate of heat loss to ambient air by convection and radiation from first glass cover

$$\alpha_{g1} I(t) = m_{g1}C_{pg1}\left(\frac{dT_g}{dt}\right) + h_{cg1g2}\left(T_{g1} - T_{g2}\right)$$
$$+ h_{rg1g2}\left(T_{g1} - T_{g2}\right) + \left(h_{cg1a} + h_{rg1a}\right)\left(T_{g1} - T_a\right) \quad (21)$$

(3.23)

Neglecting the heat capacity of first glass cover and simplifying equation, the temperature of the glass cover is given by

$$T_{g1} = \frac{\alpha_{g1}I(t) + \left(h_{cg1a} + h_{rg1a}\right)T_a + h_{cg1g2}T_{g2} + h_{rg1g2}T_{g2}}{h_{cg1a} + h_{rg1a} + h_{cg1g2} + h_{rg1g2}}$$

(22)

2.6 Energy balance equation for second glass cover

The energy balance equations for the glass cover can be written as:Rate of heat absorbed by second glass cover = Heat capacity of glass+ Rate of heat transfer from second glass cover to the fluid by convection + Rate of heat transfer from second glass cover to the absorber plate by radiation+ Rate of heat received from first glass cover by convection and radiation

$$\tau_{g1}\alpha_{g2}I(t) = m_{g2}C_{pg2}\left(\frac{dT_g}{dt}\right) + h_{cg2f}\left(T_{g2} - T_f\right) + h_{rg2p}\left(T_{g2} - T_p\right) +$$

$$h_{cg1g2}\left(T_{g1} - T_{g2}\right) + h_{rg1g2}\left(T_{g1} - T_{g2}\right)$$

(23)   (3.25)

Neglecting the heat capacity of second glass cover and simplifying eqn (3.25), the temperature of the glass cover is given by

$$T_{g2} = \frac{\alpha_{g2}\tau_{g1}I(t) + h_{cg2f}T_f + \left(h_{cg1g2} + h_{rg1g2}\right)T_{g1} + h_{rg2p}T_P}{h_{cg2f} + h_{cg1g2} + h_{rg1g2} + h_{rg2p}}$$

(24)

2.7 Energy balance equation for absorber plate

The energy balance equations for the absorber plate with insulation can be written as:

Rate of heat absorbed by absorber plate=Heat capacity of absorber plate + Rate of heat convected to the fluid from absorber plate+ Rate of heat radiated to the fluid from absorber plate + Bottom loss

$$\alpha_p\tau_{g1}\tau_{g2}I(t) = m_pC_{pp}\left(\frac{dT_p}{dt}\right) + h_{cpf}\left(T_P - T_f\right) + h_{rpg2}\left(T_p - T_{g2}\right) + U_b\left(T_p - T_a\right)$$

(25)   (3.27)

Neglecting the heat capacity of absorber plate and simplifying equation, the temperature of the glass cover is given by

$$T_p = \frac{\alpha_p\tau_{g1}\tau_{g2}I(t) + h_{cpf}T_f + h_{rg2p}T_{g2} + U_bT_a}{U_b + h_{cpf} + h_{rg2p}}$$

(26)

2.8 Energy balance equation for air flowing in the duct

The energy balance equation for the air flowing through the duct can be written as:

Rate of heat transfer from Glass cover to the fluid by convection + Rate of heat convected to the fluid from absorber plate = Heat capacity of the air + heat gain

$$h_{cg2f}\left(T_{g2} - T_f\right) + h_{cpf}\left(T_p - T_f\right) = \rho_f t_f C_{pf}\left(\frac{\partial T_f}{\partial t}\right) + \frac{m_f C_{pf}}{W}\frac{\partial T_f}{\partial x}$$ (27)   (3.29)

Where $m_f = \rho_f t_f W V_f$

Neglecting the heat capacity of the air flowing through the duct and eliminating, T_g and T_p,

$$m_f C_{pf} \frac{\partial T_f}{\partial x} = WF' \left[(\tau\alpha)_{eff} I(t) - U_L (T_f - T_a) \right] \quad (28) \tag{3.30}$$

$$(\tau\alpha)_{eff} = \frac{\tau_g \alpha_p}{1 - (1 - \alpha_p)\rho_g}, \qquad \tau_g = \frac{\tau_{g1}\tau_{g2}}{1 - \rho_{g1}\rho_{g2}}, \qquad \rho_g = \rho_{g1} + \frac{\rho_{g2}\tau_{g1}^2}{1 - \rho_{g1}\rho_{g2}}, \qquad \alpha_g = 1 - \rho_g - \tau_g$$

Where F' and U_L are the collector efficiency factor and Overall heat transfer coefficient

Collector efficiency factor (F') is given by

$$F' = \frac{h_{rpg2}h_{cg2f} + h_{cpf}(h_{cg1a} + h_{rg1a})(h_{cg1g2} + h_{rg1g2}) + h_{cpf}h_{rpg2} + h_{cg2f}h_{cpf}}{(U_b + h_{rpg2} + h_{cpf})(h_{cg1a} + h_{rg1a} + h_{cg1g2} + h_{rg1g2} + h_{cpf} + h_{rpg2}) - (h_{rpg2})^2} \tag{29}$$

Overall heat transfer coefficient of the collector (U_L) is given by

$$U_L = \frac{\begin{aligned}&(h_{cga} + h_{rga} + h_{cg1a} + h_{rg1a} + U_b)(h_{cg2f}h_{cpf} + h_{cg2f}h_{rpg2} + h_{cpf}h_{rg2p}) + \\ &U_b(h_{cg1a} + h_{rg1a})(h_{cpf} + h_{cg2f})(h_{rg1g2} + h_{cg1g2})\end{aligned}}{h_{cg2f}h_{rpg2} + h_{cpf}(h_{cg1a} + h_{rg1a})(h_{rg1g2} + h_{cg1g2}) + h_{cpf}h_{rpg2} + h_{cg2f}h_{cpf}}$$
$$+ h_{cg2f}(h_{cg1a} + h_{rg1g2})(h_{cg1a} + h_{rg1a}) + h_{rg1a}h_{cg1g2} + h_{rg1g2}h_{cg1a} \tag{30} \qquad (3.32)$$

Assuming U_L and F' to be constant and applying boundary conditions $T_f = T_{fi}$ at $x = 0$, the solution of equation is given by

$$\frac{T_f - T_a - \left(\dfrac{(\tau\alpha)_{eff} I(t)}{U_L}\right)}{T_{fi} - T_a - \left(\dfrac{(\tau\alpha)_{eff} I(t)}{U_L}\right)} = \exp\left(\frac{-U_L F' W x}{\dot{m}_f C_{pf}}\right) \tag{31} \qquad (3.33)$$

The outlet fluid temperature is obtained by substituting $T_f = T_{fo}$ at $x = L$

$$T_{fo} = \frac{(\tau_g \alpha_p I(t) + U_L T_a)}{U_L}\left[1 - \exp\frac{(-U_L W F')}{m_f c_{pf}}L\right] + T_{fi}\exp\left(\frac{-U_L W F' L}{m_f c_{pf}}\right) \tag{32}$$

3. Mathematical modelling of single glazed double channel parallel flow SAH

A single glazed double channel parallel flow SAH designed a glass cover, double air flows between glass cover and absorber plate and between absorber and bottom plates in parallel direction, and with insulation provided. Many papers have investigated this design [11] [12].

Fig 6 Cross sectional view and nomenclature

A single glazed double channel parallel flow SAH has a glass cover having an absorptivity of 0.05 and transmissivity of 0.95. The absorber plate is 2.4 m long, 0.6 m wide and is placed 5 mm below the glass cover and 7 mm above back plate. The air is made to flow through the 5 mm gap between the glass cover and the absorber plate and also through the 7 mm gap between the absorber plate and the bottom plate. The air flows in parallel direction through the channel. The effective area of absorber plate exposed to solar radiation is 1.44 m². The system is inclined

at an angle of 35° to the horizontal facing south. Fig. 6 shows the cross-sectional view along with all necessary nomenclatures.

3.1 Energy balance equation for Glass cover

The energy balance equations for the glass cover can be written as:

Rate of heat absorbed by the Glass cover = Heat capacity of glass+ Rate of heat transfer from glass cover to the fluid by convection + Rate of heat transfer from the glass cover to the absorber plate by radiation+ Rate of heat loss to ambient air by convection and radiation

$$\alpha_g I(t) = m_g C_{pg}\left(\frac{dT_g}{dt}\right) + h_{cgf1}\left(T_g - T_{f1}\right) + h_{rgp}\left(T_g - T_p\right) + \left(h_{cga} + h_{rga}\right)\left(T_g - T_a\right) \tag{33}$$

Neglecting the heat capacity of glass cover and simplifying equation, the temperature of the glass cover is given by

$$T_g = \frac{\left(h_{cga} + h_{rga}\right)T_a + h_{cgf1}T_{f1} + h_{rgp}T_p}{h_{cga} + h_{rga} + h_{cgf1} + h_{rgp}} \tag{34}$$

3.2 Energy balance equation for back plate

The energy balance equations for the back plate with insulation can be written as: Rate of heat radiated from absorber plate = Bottom loss + Rate of heat convected by the plate to fluid in second channel

$$h_{rpb}\left(T_p - T_b\right) = U_b\left(T_b - T_a\right) + h_{cbf2}\left(T_b - T_{f2}\right) \tag{35}$$

The temperature of the back plate is given by
$$T_b = \frac{U_b T_a + h_{cbf2}T_{f2} + h_{rpb}T_p}{U_b + h_{cbf2} + h_{rbp}} \tag{36}$$

3.3 Energy balance equation for absorber plate

The energy balance equations for the absorber plate can be written as:

Rate of heat absorbed by absorber plate + Rate of heat transfer from the glass cover to the absorber plate by radiation =Heat capacity of absorber plate +Rate of heat convected to the fluid in second channel by absorber plate+ Rate of heat radiated by absorber plate to the bottom plate + Rate of heat convected to the fluid in first channel by absorber plate

$$\tau_g \alpha_p I(t) + h_{rgp}\left(T_g - T_p\right) = m_p C_{pp}\left(\frac{dT_p}{dt}\right) + h_{cpf2}(T_p - T_{f2}) + h_{rpb}(T_p - T_b) + h_{cpf1}\left(T_p - T_{f1}\right) \tag{37}$$

Neglecting the heat capacity of absorber plate and substituting the values of T_g and T_b in equation above, . The absorber plate temperature is given by

$$T_p = \frac{\begin{aligned}I(t)\sigma_1\sigma_2 + \left(h_{cpf1}\sigma_1 + h_{cgf1}h_{rgp}\right)\sigma_2 T_{f1} + \left(h_{cpf2}\sigma_2 + h_{cbf2}h_{rpb}\right)\sigma_1 T_{f2} \\ + \left(h_{rgp}\left(h_{cga} + h_{rga}\right)\sigma_2 + h_{rpb}U_b\sigma_1\right)T_a\end{aligned}}{\left(h_{cpf1} + h_{cpf2}\right)\sigma_1\sigma_2 + h_{rpg}\left(h_{cga} + h_{rga} + h_{cgf1}\right)\sigma_2 + h_{rpb}(U_b + h_{cbf2})\sigma_1} \tag{38}$$

where $\sigma_1 = h_{cga} + h_{rga} + h_{cgf1} + h_{rgp}$, $\sigma_2 = U_b + h_{cbf2} + h_{rpb}$

3.4 Energy balance equation for air flowing in first channel

The energy balance equation for the air flowing through the duct can be written as:
Rate of heat convected by glass cover + Rate of heat convected by the absorber plate = Heat capacity of the air +Heat gain

$$h_{cgf1}\left(T_g - T_{f1}\right) + h_{cpf1}\left(T_p - T_{f1}\right) = \rho_f t_f C_{pf}\left(\frac{\partial T_f}{\partial t}\right) + \frac{m_{f1}C_{pf}}{W}\frac{\partial T_{f1}}{\partial x} \quad (39)$$

3.5 Energy balance equation for air flowing in second channel

The energy balance equation for the air flowing through the duct can be written as:
Rate of heat convected by absorber plate + Rate of heat convected by the bottom plate = Heat capacity of the air + Heat gain

$$h_{cpf2}\left(T_p - T_{f2}\right) + h_{cbf2}\left(T_b - T_{f2}\right) = \rho_f t_f C_{pf}\left(\frac{\partial T_f}{\partial t}\right) + \frac{m_{f2}C_{pf}}{W}\frac{\partial T_{f2}}{\partial x} \quad (40)$$ Neglecting the heat capacity of the air and substituting the values of T_b, T_p, T_g in equations and adding them the useful heat gain is given by

$$m_{f1}C_{pf}\frac{\partial T_{f1}}{\partial x} + m_{f2}C_{pf}\frac{\partial T_{f2}}{\partial x} = WF'\left[(\tau\alpha)_{eff}I(t) - U_{01}\left(T_{f1} - T_a\right) - U_{02}\left(T_{f2} - T_a\right)\right] (41)$$

Where F' and U_L are the collector efficiency factor and overall loss coefficient.
Collector efficiency factor (F') is given by

$$F' = \frac{(h_{cpf1} + h_{cpf2})\sigma_1\sigma_2 + h_{cgf1}h_{rgp}\sigma_2 + h_{cbf2}h_{rpb}\sigma_1}{\sigma_3} \quad (42)$$

$$U_{01} = \frac{h_{cgf1}U_t\sigma_3 + \left(h_{cpf1}\sigma_1 + h_{cgf1}h_{rgp}\right)\left(h_{rgp}U_t\sigma_2 + h_{rpb}U_b\sigma_1\right)}{\left[\left(h_{cpf1} + h_{cpf2}\right)\sigma_1\sigma_2 + h_{cgf1}h_{rgp}\sigma_2 + h_{cbf2}h_{rpb}\sigma_1\right]\sigma_1} \quad (43)$$

$$U_{02} = \frac{h_{cbf2}U_b\sigma_3 + \left(h_{cpf2}\sigma_2 + h_{cbf2}h_{rpb}\right)\left(h_{rgp}U_t\sigma_2 + h_{rpb}U_b\sigma_1\right)}{\left[\left(h_{cpf1} + h_{cpf2}\right)\sigma_1\sigma_2 + h_{cgf1}h_{rgp}\sigma_2 + h_{cbf2}h_{rpb}\sigma_1\right]\sigma_1} \quad (44)$$

$$\sigma_3 = \left(h_{cpf1} + h_{cpf2}\right)\sigma_1\sigma_2 + h_{rgp}\left(U_t + h_{cgf1}\right)\sigma_2 + h_{rpb}\left(U_b + h_{cbf2}\right)\sigma_1 (45)$$

Overall heat transfer coefficient U_L is given by

$$U_L = U_{01} + U_{02} \quad (46)$$

Equation (3.43) can be written as

$$m_f C_{pf}\frac{\partial T_f}{\partial x} = WF'\left[(\tau\alpha)_{eff}I(t) - U_L\left(T_f - T_a\right)\right] (47) \quad (3.49)$$

Where $T_f = \frac{U_{01}T_{f1} + U_{02}T_{f2}}{U_L}$

To estimate each convection heat transfer coefficients inside both channels of the collector, it is necessary to calculate the mean values of T_{f1} and T_{f2} between the positions of the air inlet and outlet according to these authors recommendation. The values of T_{f1} and T_{f2} is obtained by differentiating the equations below. By applying boundary conditions; $T_{f1}(0) = T_{f2}(0) = T_i$ the solution of these equations are given below

$$T_{f1}(x) = K_1\exp(\alpha_1 x) + K_2\exp(\alpha_2 x) + C \quad (48)$$

$$T_{f2}(x) = K_1\exp(\alpha_1 x) - \frac{U_{01}}{U_{02}}K_2\exp(\alpha_2 x) + D \quad (49)$$

where $\alpha_1 = -\frac{A_c F' U_L}{m_f C_{pf} L}$, $\alpha_2 = -\frac{A_c F' U_L}{m_f C_{pf} L}\left(1 + \frac{U_L U_{12}^1}{U_{02} U_{01}^1}\right)$,

$$K_1 = T_i - T_a - \frac{I(t)}{U_L}\left[\frac{U'_{01}U'_{02} + U_L(U^1_{12} + U^2_{12})}{U'_{01}U'_{02} + U^1_{12}U'_{02} + U^2_{12}U'_{01}}\right] \quad K_2 = \frac{I(t)}{U_L}\left[\frac{U'_{02}(U'_{01} - U'_{02})}{U'_{01}U'_{02} + U^1_{12}U'_{02} + U^2_{12}U'_{01}}\right]$$,

$$C = T_a + \left(\frac{U'_{02} + U^1_{12} + U^2_{12}}{U'_{01}U'_{02} + U^1_{12}U'_{02} + U^2_{12}U'_{01}}\right)I(t) \quad D = T_a + \left(\frac{U'_{01} + U^1_{12} + U^2_{12}}{U'_{01}U'_{02} + U^1_{12}U'_{02} + U^2_{12}U'_{01}}\right)I(t)$$ (50)

$$F'_1 = \frac{h_{cpf1}\sigma_1\sigma_2 + h_{cgf1}h_{rgp}\sigma_2}{\sigma_3}, \quad F'_2 = \frac{h_{cpf2}\sigma_1\sigma_2 + h_{cbf2}h_{rpb}\sigma_1}{\sigma_3}$$

$$U'_{01} = \frac{F'U_{01}}{F'_1}, \quad U'_{02} = \frac{F'U_{02}}{F'_2}, \quad U^1_{12} = \frac{h_{cpf2}\sigma_2 + h_{cbf2}h_{rpb}}{\sigma_2}, \quad U^2_{12} = \frac{h_{cpf1}\sigma_1 + h_{cgf1}h_{rgp}}{\sigma_1}$$

Outlet air temperature is obtained by differentiating eqn (4.49) and the solution of equation is given by

$$\frac{T_f - T_a - \left(\dfrac{(\tau\alpha)_{eff}\,I(t)}{U_L}\right)}{T_{fi} - T_a - \left(\dfrac{(\tau\alpha)_{eff}\,I(t)}{U_L}\right)} = \exp\left(\frac{-U_L F'Wx}{\dot{m}_f C_{pf}}\right)$$

(51) The outlet fluid temperature is obtained by substituting $T_f = T_{fo}$ at $x = L$

$$T_{fo} = \frac{(\tau_g\alpha_p I(t) + U_L T_a)}{U_L}\left[1 - \exp\frac{(-U_L W\,F')}{m_f c_{pf}}L\right] + T_{fi}\exp\left(\frac{-U_L WF\,L}{m_f c_{pf}}\right)$$ (52)

4. Mathematical modelling of single glazed double channel counter flow SAH

A single glazed double channel counter flow SAH designed a glass cover, double air flows between glass cover and absorber plate and between absorber and bottom plates in opposite direction, and with insulation provided.

Fig. 7 Cross sectional view and nomenclature

In a single glazed double channel counter flow SAH, the absorber plate is 2.4 m long, 0.6 m wide and is placed 5 mm below the glass cover and 7 mm above back plate. The air is made to flow first through the 5 mm gap between the glass cover and the absorber plate and then directed to flow through the 7 mm gap between the absorber plate and the bottom plate. Thus, air flows in opposite directions through the channel. The effective area of absorber plate [13] exposed to solar radiation is 1.44 m^2. The system is inclined at an angle of 35° to the horizontal facing south.

Fig. 7 shows the cross-sectional view along with all necessary nomenclatures.

4.1 Energy balance equation for Glass cover

The energy balance equations for the glass cover can be written as:

Rate of heat absorbed by the Glass cover = Heat capacity of glass+ Rate of heat transfer from glass cover to the fluid by convection + Rate of heat transfer from the glass cover to the absorber plate by radiation+ Rate of heat loss to ambient air by convection and radiation

$$\alpha_g I(t) = m_g C_{pg}\left(\frac{dT_g}{dt}\right) + h_{cgf1}\left(T_g - T_{f1}\right) + h_{rgp}\left(T_g - T_p\right) + \left(h_{cga} + h_{rga}\right)\left(T_g - T_a\right)$$

(53) Neglecting the heat capacity of glass cover and simplifying eqn (3.54), the temperature of the glass cover is given by

$$T_g = \frac{\left(h_{cga} + h_{rga}\right)T_a + h_{cgf1}T_{f1} + h_{rgp}T_p}{h_{cga} + h_{rga} + h_{cgf1} + h_{rgp}}$$

(54)

4.2 Energy balance equation for back plate

The energy balance equations for the back plate with insulation can be written as:

Rate of heat radiated from absorber plate = Bottom loss + Rate of heat convected by the plate to fluid in second channel

$$h_{rpb}\left(T_p - T_b\right) = U_b\left(T_b - T_a\right) + h_{cbf2}\left(T_b - T_{f2}\right)$$ (55)

The temperature of the back plate is given by
$$T_b = \frac{U_b T_a + h_{cbf2}T_{f2} + h_{rpb}T_p}{U_b + h_{cbf2} + h_{rbp}}$$ (56)

4.3 Energy balance equation for absorber plate

The energy balance equations for the absorber plate can be written as:

Rate of heat absorbed by absorber plate + Rate of heat transfer from the glass cover to the absorber plate by radiation =Heat capacity of absorber plate +Rate of heat convected to the fluid in second channel by absorber plate+ Rate of heat radiated by absorber plate to the bottom plate + Rate of heat convected to the fluid in first channel by absorber plate

$$\tau_g \alpha_p I(t) + h_{rgp}\left(T_g - T_p\right) = m_p C_{pp}\left(\frac{dT_p}{dt}\right) + h_{cpf2}(T_p - T_{f2}) + h_{rpb}(T_p - T_b) + h_{cpf1}\left(T_p - T_{f1}\right)$$ (57)

Neglecting the heat capacity of absorber plate and substituting the values of Tg and T$_b$ in equation above, the absorber plate temperature is given by

$$T_p = \frac{\begin{array}{l}I(t)\sigma_1\sigma_2 + \left(h_{cpf1}\sigma_1 + h_{cgf1}h_{rgp}\right)\sigma_2 T_{f1}\\ + \left(h_{cpf2}\sigma_2 + h_{cbf2}h_{rpb}\right)\sigma_1 T_{f2} + \left(h_{rgp}\left(h_{cga} + h_{rga}\right)\sigma_2 + h_{rpb}U_b\sigma_1\right)T_a\end{array}}{\left(h_{cpf1} + h_{cpf2}\right)\sigma_1\sigma_2 + h_{rpg}\left(h_{cga} + h_{rga} + h_{cgf1}\right)\sigma_2 + h_{rpb}(U_b + h_{cbf2})\sigma_1}$$ (58)

Where $\sigma_1 = h_{cga} + h_{rga} + h_{cgf1} + h_{rgp}$, $\sigma_2 = U_b + h_{cbf2} + h_{rpb}$

4.4 Energy balance equation for air flowing in first channel

The energy balance equation for the air flowing through the duct can be written as:

Rate of heat convected by glass cover + Rate of heat convected by the absorber plate = Heat capacity of the air +Heat gain

$$h_{cgf1}\left(T_g - T_{f1}\right) + h_{cpf1}\left(T_p - T_{f1}\right) = \rho_f t_f C_{pf}\left(\frac{\partial T_f}{\partial t}\right) + \frac{m_{f1}C_{pf}}{W}\frac{\partial T_{f1}}{\partial x} \quad (59)$$

4.5 Energy balance equation for air flowing in second channel

The energy balance equation for the air flowing through the duct can be written as:

Rate of heat convected by absorber plate + Rate of heat convected by the bottom plate = Heat capacity of the air +Heat gain

$$h_{cpf2}\left(T_p - T_{f2}\right) + h_{cbf2}\left(T_b - T_{f2}\right) = \rho_f t_f C_{pf}\left(\frac{\partial T_f}{\partial t}\right) + \frac{m_{f2}C_{pf}}{W}\frac{\partial T_{f2}}{\partial x} \quad (60)$$

Neglecting the heat capacity of the air and substituting the values of T_b, T_p, T_g in equations and adding them the useful heat gain is given by

$$m_{f1}C_{pf}\frac{\partial T_{f1}}{\partial x} + m_{f2}C_{pf}\frac{\partial T_{f2}}{\partial x} = WF'\left[(\tau\alpha)_{eff}I(t) - U_{01}\left(T_{f1} - T_a\right) - U_{02}\left(T_{f2} - T_a\right)\right] \quad (61)$$ where F' and U_L are the collector efficiency factor and overall loss coefficient.

Collector efficiency factor (F') is given by

$$F' = \frac{(h_{cpf1} + h_{cpf2})\sigma_1\sigma_2 + h_{cgf1}h_{rgp}\sigma_2 + h_{cbf2}h_{rpb}\sigma_1}{\sigma_3} \quad (62)$$

$$U_{01} = \frac{h_{cgf1}U_t\sigma_3 + \left(h_{cpf1}\sigma_1 + h_{cgf1}h_{rgp}\right)\left(h_{rgp}U_t\sigma_2 + h_{rpb}U_b\sigma_1\right)}{\left[\left(h_{cpf1} + h_{cpf2}\right)\sigma_1\sigma_2 + h_{cgf1}h_{rgp}\sigma_2 + h_{cbf2}h_{rpb}\sigma_1\right]\sigma_1} \quad (63)$$

$$U_{02} = \frac{h_{cbf2}U_b\sigma_3 + \left(h_{cpf2}\sigma_2 + h_{cbf2}h_{rpb}\right)\left(h_{rgp}U_t\sigma_2 + h_{rpb}U_b\sigma_1\right)}{\left[\left(h_{cpf1} + h_{cpf2}\right)\sigma_1\sigma_2 + h_{cgf1}h_{rgp}\sigma_2 + h_{cbf2}h_{rpb}\sigma_1\right]\sigma_1} \quad (64)$$

Overall heat transfer coefficient U_L is given by

$$U_L = U_{01} + U_{02} \quad (65)$$

Eq (4.62) can be written as

$$m_f C_{pf}\frac{\partial T_f}{\partial x} = WF'\left[(\tau\alpha)_{eff}I(t) - U_L\left(T_f - T_a\right)\right] \quad (66) \quad (3.68)$$

$$T_f = \frac{U_{01}T_{f1} + U_{02}T_{f2}}{U_L} \quad (67)$$

To estimate each convection heat transfer coefficients inside both channels of the collector, it is necessary to calculate the mean values [14] of T_{f1} and T_{f2} between the positions of the air inlet and outlet according to these authors recommendation. The values of T_{f1} and T_{f2} is obtained by differentiating the equations Fig

By applying the boundary conditions

$T_{f1}(0) = T_{fi}$ and $T_{f1}(L) = T_{f2}(L)$

The solution of these equations are given below

$$T_{f1}(x) = K_1K_3\exp(\alpha_1 x) + K_2K_4\exp(\alpha_2 x) + C \quad (68)$$

$$T_{f2}(x) = K_1\exp(\alpha_1 x) + K_2\exp(\alpha_2 x) + D \quad (69)$$

where $$\alpha_1 = \frac{1A_c F'U_L}{2m_f C_{pf}L}\left[\frac{(U_{02} - U_{01})}{U_L} + \sqrt{1 + \frac{4U_{01}U_{12}^1}{U_L U_{01}'}}\right], \quad \alpha_2 = \frac{1A_c F'U_L}{2m_f C_{pf}L}\left[\frac{(U_{02} - U_{01})}{U_L} - \sqrt{1 + \frac{4U_{01}U_{12}^1}{U_L U_{01}'}}\right] \quad (70)$$

$$C = T_a + \left(\frac{U_{02}' + U_{12}^1 + U_{12}^2}{U_{01}'U_{02}' + U_{12}^1 U_{02}' + U_{12}^2 U_{01}'}\right)I(t), \quad D = T_a + \left(\frac{U_{01}' + U_{12}^1 + U_{12}^2}{U_{01}'U_{02}' + U_{12}^1 U_{02}' + U_{12}^2 U_{01}'}\right)I(t) \quad (71)$$

$$Y = \left(U'_{02} - \frac{m_f C_{pf} \alpha_2}{WF'_2} \right) \left(U'_{02} + U^2_{12} - \frac{m_f C_{pf} \alpha_1}{WF'_2} \right) \exp(\alpha_2 L)$$

$$- \left(U'_{02} - \frac{m_f C_{pf} \alpha_1}{WF'_2} \right) \left(U'_{02} + U^2_{12} - \frac{m_f C_{pf} \alpha_2}{WF'_2} \right) \exp(\alpha_1 L) \quad (72)$$

$$F'_1 = \frac{h_{cpf1}\sigma_1\sigma_2 + h_{cgf1}h_{rgp}\sigma_2}{\sigma_3}, \quad F'_2 = \frac{h_{cpf2}\sigma_1\sigma_2 + h_{cbf2}h_{rpb}\sigma_1}{\sigma_3} \quad (73)$$

$$U'_{01} = \frac{F'U_{01}}{F'_1}, \quad U'_{02} = \frac{F'U_{02}}{F'_2}, \quad U^1_{12} = \frac{h_{cpf2}\sigma_2 + h_{cbf2}h_{rpb}}{\sigma_2}, \quad U^2_{12} = \frac{h_{cpf1}\sigma_1 + h_{cgf1}h_{rgp}}{\sigma_1}$$

$$K_1 = \frac{-U^2_{12}\left[1 - \dfrac{U'_{02}\left(U'_{02} + U^1_{12} + U^2_{12}\right) + \left(U'_{01} - U'_{02}\right)\dfrac{m_f C_{pf}\alpha_2}{WF'_2}}{U'_{01}U'_{02} + U^1_{12}U'_{02} + U^2_{12}U'_{01}}\right]I(t) + U^2_{12}(T_i - C)\left(U'_{02} - \dfrac{m_f C_{pf}\alpha_2}{WF'_2}\right)\exp(\alpha_2 L)}{Y} \quad (74)$$

$$K_2 = \frac{U^2_{12}\left[1 - \dfrac{U'_{02}\left(U'_{02} + U^1_{12} + U^2_{12}\right) + \left(U'_{01} - U'_{02}\right)\dfrac{m_f C_{pf}\alpha_1}{WF'_2}}{U'_{01}U'_{02} + U^1_{12}U'_{02} + U^2_{12}U'_{01}}\right]I(t) - U^2_{12}(T_i - C)\left(U'_{02} - \dfrac{m_f C_{pf}\alpha_1}{WF'_2}\right)\exp(\alpha_1 L)}{Y} \quad (75)$$

$$K_3 = 1 + \frac{1F'U_L}{2F'_2U^2_{12}}\left[1 - \sqrt{1 + \frac{4U_{01}U^1_{12}}{U_L U'_{01}}}\right] \quad (76) \qquad K_4 = 1 + \frac{1F'U_L}{2F'_2U^2_{12}}\left[1 + \sqrt{1 + \frac{4U_{01}U^1_{12}}{U_L U'_{01}}}\right] \quad (77)$$

The outlet air temperature is obtained by evaluating eqn (4.68) at x = 0

$$T_{fo} = T_{f2}(0) = K_1 + K_2 + D \quad (78)$$

5. Simulation Results

These data are classified into four climatic conditions depending upon the ratio of daily diffuse to daily global radiations and number of sunshine hour, namely: Type A; Type B; Type C and Type D, Type a: The clear days (blue sky), the ratio of daily diffuse to daily global irradiation is less than or equal to 0.25 and number of sunshine hour is greater than or equal to 9 hours. Type b: The Hazy days (fully), the ratio of daily diffuse to daily global irradiation between 0.25-0.50 and number of sunshine hour is between 7 to 9 hours. Type c: The Hazy and cloudy (partially) days, the ratio of daily diffuse to daily global irradiation between 0.50-0.75 and number of sunshine hour is between 5 to 7 hours. Type d:

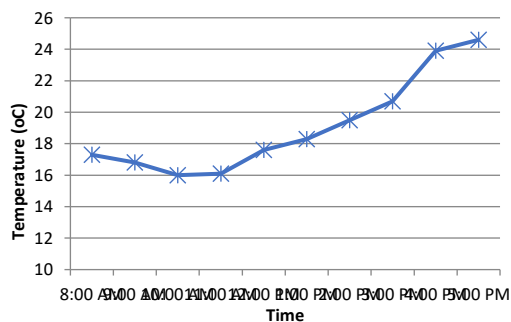

Fig.8 Hourly variations in temp of air for weather condition of type A

Fig. 9 Hourly variation of solar radiation for weather condition of type A

Fig 8 shows the hourly variation of ambient air temperature of the Srinagar for a typical day of weather condition of type A for the month of May. There is gradual increase in the temperature of ambient air from morning till evening.

Fig 9 shows the hourly variation of solar radiation for a typical day of type A for the month of May. Solar radiation intensity is less in the morning that increase gradually till noon and again decrease from noon to evening.
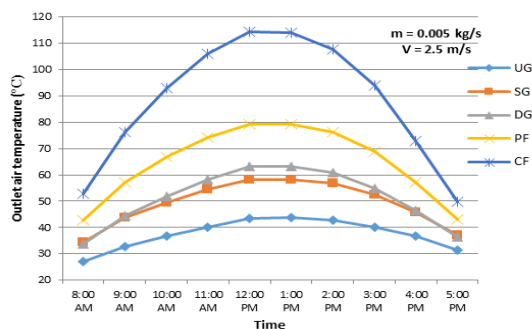

Fig. 10 Hourly variation of outlet temperature

Fig 10 shows the hourly variation of air temperature at the outlet for different geometries of solar air heater, namely UG = transpired SAH; SG = single glazed SAH; DG = double glazed single channel SAH; PF = single glazed double channel parallel flow SAH; CF = single glazed double channel counter flow SAH, in weather conditions of Type A and month May. It is also observed that average flow velocity through the duct as 2.5 m/s, the outlet temperature for counter flow SAH is maximum at the noon and attains a value of 115°C, parallel flow SAH attains a maximum temperature of 79°C followed by double glazed SAH, single glazed SAH and transpired SAH.
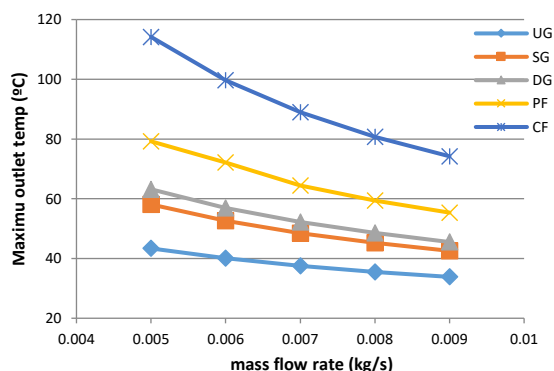

Fig. 11 Effect of mass flow rate on outlet air temperature

Fig 11 shows the effect of air mass flow rate through duct on the outlet air temperature. It is found that for the counter flow SAH the outlet air temperature is nearly 114°C at the mass flow rate of 0.005 kg/s and falls to 74°C at the mass flow rate of 0.009 kg/s.

Fig 12 shows the top loss for different geometries of SAH. Top loss is highest for transpired SAH compared to other geometries owing to absence of greenhouse effect and therefore the performance is very poor.
Figure 12 Top loss for different type of SAH

It increases linearly with the increase in the intensity of the solar radiation. Glazing reduces the top loss (single flow and double flow) significantly. For the double glazed SAH the top loss is minimum and do not have significant change with the intensity of the solar radiation.

Figure 13 Effect of mass flow rate on useful heat gain

Fig 13 shows the effect of air mass flow rate through duct on the useful heat gain. It is being observed that with an increase in mass flow rate from 0.005 kg/s – 0.009 kg/s the useful heat gain for all geometries of SAH also increases. The heat gain is directly proportional to the mass flow rate. It is maximum for the counter flow SAH and is least for transpired solar air heater.

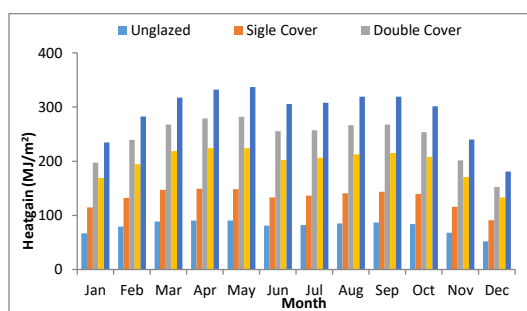

Fig 14 Efficiency variation with mass flow rate

Fig 15 Annual Heat gain

Fig 14 shows the effect of air mass flow rate through duct over the efficiency of SAH. The efficiency of the SAH is directly proportional to mass flow rate.

Fig 15 shows the effect of air mass flow rate through duct over the heat gain under different climatic conditions of the year. The useful heat gain increases is highest in the clear days of summer month particularly in the month of April-May and lowest in the cloudy days of winter month particularly in the month of December. It is further observed that the highest heat gain is for the counter flow arrangement, followed by double glazed arrangement.

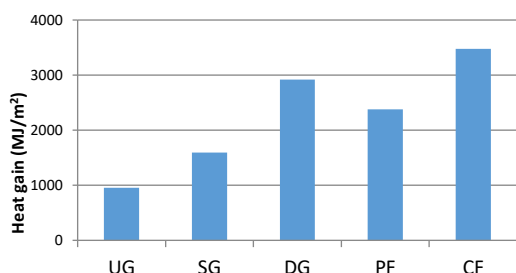

Figure 16 Useful Heat gain for different geometry of solar air heater

Fig 16 shows the annual useful heat gain for different geometries of solar air heaters. The annual heat gain for transpired SAH, single glazed SAH, double glazed SAH, parallel flow SAH and counter flow SAH are 950 MJ/m^2, 1590 MJ/m^2, 2920 MJ/m^2, 2380 MJ/m^2 and 3480 MJ/m^2 respectively. Thus the best configuration is the single glazed solar heater with counter flow arrangement.

6. Conclusions

However, it reduces the air outlet temperature. Counter flow SAH has relatively better performance as compared to other arrangement of SAH. Solar air heaters are very useful for rural areas by improving living standard of farmers by earning through crop drying and medicinal points.
